

April 16, 2024

**PMAJ Roy P. Tayona**

Chief of Police, Lambunao PNP

Dear Sir Tayona,

*Warm Greetings!*

The academic program for the Bachelor of Science in Software Engineering (BSSE) at Central Philippine University mandates that students undertaking software engineering studies undertake a practical-based design or research project that encompasses the diverse components of a conventional engineering endeavor. In line with this program, Service Learning (SL) is integrated by stipulating that all students complete a capstone project spanning two semesters.

The SE 3222 (Software Engineering Capstone Project I) and SE 4121 (Software Engineering Capstone Project II) are subjects taken by the BSSE students of CPU. These courses are geared towards the use of software engineering background in probable community development projects or industry research. A group of three to four students with the guidance of a software engineering faculty adviser undertakes a project study on the design of software engineering projects.

In line with this, I, Rafael III J. Prudente, a third-year Software Engineering student at Central Philippine University, along with my research colleagues, Paul Vincent Lerado, Candace Hyacinth Yu, and Chrishyl John Laloy are planning to conduct an interview with you. In this discussion, we wish to gather your insight into our capstone project idea which is an innovative safety solution designed to address the issues of motorcycle-related accidents in the Philippines with declining helmet usage rates and a concerning increase in fatalities due to drunk driving. Our solution will consist of both hardware and software components, the hardware aspect features an IoT device powered by solar energy, seamlessly integrated into the motorcycle's ignition system. An IR sensor ensures the driver wears their helmet properly before the motorcycle can be activated. Additionally, an MQ-3 alcohol sensor detects the driver's alcohol level, preventing ignition if it exceeds a predefined threshold. Complementing the hardware is a mobile application, that offers real-time data on the driver's location, alcohol level, and ignition status. Users can input emergency contact information to enable them to communicate with emergency responders and nearby hospitals, which are automatically notified in case of an emergency.

With all these, we humbly ask for your time to have an in-person interview with us this week. We are happy to negotiate whatever day and time work best for you. If you are interested in helping us with this endeavor, kindly inform us through me, Mr. Rafael III J. Prudente, the team's Project Leader. You may contact me through mobile phone number at 09630392433 (TNT) or email at rafaeliii.prudente-21@cpu.edu.ph.

Thank you for taking the time to read this letter. We hope you will consider our request.

Respectfully,

In line with this, I, Rafael III J. Prudente, a third-year Software Engineering student at Central Philippine University, along with my research colleagues, Paul Vincent Lerado, Candace Hyacinth Yu, and Chrishyl John Laloy are planning to conduct an interview with you. In this discussion, we wish to gather your insight into our capstone project idea which is an innovative safety solution designed to address the issues of motorcycle-related accidents in the Philippines with declining helmet usage rates and a concerning increase in fatalities due to drunk driving. Our solution will consist of both hardware and software components, the hardware aspect features an IoT device powered by solar energy, seamlessly integrated into the motorcycle's ignition system. An IR sensor ensures the driver wears their helmet properly before the motorcycle can be activated. Additionally, an MQ-3 alcohol sensor detects the driver's alcohol level, preventing ignition if it exceeds a predefined threshold. Complementing the hardware is a mobile application, that offers real-time data on the driver's location, alcohol level, and ignition status. Users can input emergency contact information to enable them to communicate with emergency responders and nearby hospitals, which are automatically notified in case of an emergency.

With all these, we humbly ask for your time to have an in-person interview with us this week. We are happy to negotiate whatever day and time work best for you. If you are interested in helping us with this endeavor, kindly inform us through me, Mr. Rafael III J. Prudente, the team's Project Leader. You may contact me through mobile phone number at 09630392433 (TNT) or email at rafaeliii.prudente-21@cpu.edu.ph.

Thank you for taking the time to read this letter. We hope you will consider our request.

Respectfully,

*Raf*

## SOFTWARE ENGINEERING DEPARTMENT

79-3

April 16, 2024

**Derrick Kukoc Parcon Sombe**

ER Nurse, Iloilo Mission Hospital

Dear Sir Sombe,

Warm Greetings!

The academic program for the Bachelor of Science in Software Engineering (BSSE) at Central Philippine University mandates that students undertaking software engineering studies undertake a practical-based design or research project that encompasses the diverse components of a conventional engineering endeavor. In line with this program, Service Learning (SL) is integrated by stipulating that all students complete a capstone project spanning two semesters.

The SE 3222 (Software Engineering Capstone Project I) and SE 4121 (Software Engineering Capstone Project II) are subjects taken by the BSSE students of CPU. These courses are geared towards the use of software engineering background in probable community development projects or industry research. A group of three to four students with the guidance of a software engineering faculty adviser undertakes a project study on the design of software engineering projects.
